## LAURA AND CLAUDINE - TRAINING UPDATE

The Bioclear method and modern smile design can correct many aesthetic dilemmas; such as black triangles, diastema closure and uneven, worn, or broken teeth.

Bioclear is a minimally invasive treatment which uses clear matrix systems that are then filled with gently warmed composite.

The clear matrix sits just below the gum line so that the teeth appear natural. Using this technique dentist is able to fill black triangles, close gaps and build up uneven teeth.

When the matrix is removed and the composite material has been injected, the end result is a smooth contoured composite that has a beautiful shine.

## **LEAD NURSE ZOE - VOLUNTEERING IN MOROCCO**

“Wow! What a great experience, I don’t even have the words to describe it, it was incredible. A very tiring week in the Rif Mountains in Morocco volunteering with Dental Mavericks, but the most rewarding week. This was my first volunteering trip and I loved every minute of it. We stayed in the loveliest family home, where the sisters and mother cooked all our meals and joined in with our entertainment each evening, teaching us basic Arabic too - and laughing when we pronounced it wrong! During my stay, we provided free dental care to 3 different schools, totaling a final number of 887 children being seen. Each child was triaged and treated depending on their dental needs. All children received a toothbrush, toothpaste and brushing advice once seen by a dental professional.”
